

Zellic Remediations

Last updated 8/21/2026

The following document enumerates the remediations for each Zellic audit finding.

3.1 Using `convertToAssets` will overstate adapter value for fee-charging vaults

- Fix commit: 267e13bee2493fc4b96ee3a5034f4e8d7a6280e9
- Solution: Change `realAssets` to use `previewRedeem` internally, so that the reported value includes withdrawal fees and reflects the assets obtainable by redeeming the adapter's current share balance.

3.2 Cross-chain UNSTAKE bypasses restricted-account enforcement

- Fix commit: 9d002a3daf336fc89f8d6a4563622f9f1702df67
- Solution: Add a step before processing the payload that verifies if an account is restricted or not, in the case of a Solana address, only the last 20 bytes are taken into consideration. We acknowledge the risk of more than one address having the same last 20 bytes, but we understand that there is a very low probability of encountering such a scenario.

3.3 Floor rounding in the rate-bound check breaks the signed-quote invariant

- Fix commit: 2899861250b3551e0df9a0246e2bbac48a490539
- Solution: Use `Math.mulDiv` rounding up, to round the quotient up before comparing it with the signed limit.

3.4 Unguarded sender casting is inconsistent with the contract's defensive pattern

- Fix commit: 39f8c98c0915e1b76e694ed0ddaa931e51a0ead2

- Solution: Normalize `message.sender` once with `_normalizeToBytes32()` before cooldown authorization, storage, or event emission, and reuse the normalized value throughout `processMessage()`.

3.5 Missing identity validation allows self-referential adapter deployment

- Fix commit: `b5a6bc92ffad5abaf135bba97a0d3ed80513a5a9`
- Solution: Add an explicit identity check in the constructor to reject self-referential deployments at the point of creation, and a self referential error.

3.6 Stale cooldown ownership entries are not cleared after terminal actions

- Fix commit: `4f45d807d420185a46c20230bcbdda5141de0453`
- Solution: Delete the `cooldownAccounts` entry after `_processPayload()` successfully completes an `UNSTAKE` or `CANCEL_COOLDOWN`

3.7 Obsolete fee role constants remain after fee functionality was removed

- Fix commit: `4ce82c1b4dbccfb95a2931d6f39bd038c194258e`
- Solution: Delete reported unused variables.
